Description

Description:

Vitix Gel is intended to promote epidermal repigmentation, and its activity has been confirmed by numerous clinical studies.

Vitix gel has a totally innovative mode of action through its ability to re-establish the physiological balance of free radicals in epidermal cells (melanocytes and keratinocytes) thanks to a patented plant-derived active ingredient, (EXTRAMEL®), rich in antioxidants. VITIX gel is an opaque, non-greasy gel, with a slightly granular appearance. The microspheres in its formula contain and protect the plant-derived active ingredient which is particularly sensitive.

Use:

Should be applied once or twice a day to the affected areas as well as on the contour of the lesions. After penetration, you may apply a regular skin care cream or makeup. VITIX® gel may be used in combination with phototherapy.
