Description

Description:

The specific active ingredients contained in the calming Cream were tested to verify their capability in penetrating the different cutaneous layers, where they efficaciously play their cosmetic function. Panthenol with its marked humectant properties has a softening and protective effect on the skin; Allantoin is an emollient molecule with a strong soothing power; Acetyl Hexapeptide-37 promotes the exchange of water among skin cells; Biotin is an important coenzyme whose lack causes diffuse skin disorders. The 8 Hyaluronic Acids with different molecular weights of Fillerina patent differently penetrate the cutaneous layers of both epidermis and dermis, thus providing an essential advantage to the skin

Use:

Apply the Calming Cream as necessary to the flushed or irritated skin areas. It gives immediate relief.
